Why are Investors Interested in Single-Family Rentals (SFR)?

- Supply side: historic lack of new building, both in single-family and multifamily housing since Great Recession (Gorback & Keys (2024))
- ▶ Demand Side: Rise in Millenial population saddled with debt, lower incomes, and less wealth ⇒ ↓ homeownership as they begin to demand more space (Mabille (2023))
- **Equilibrium:** Potentially lucrative to own SFR and extract rents

### **Research Question**

# What is the impact of increased institutional ownership of single-family rentals (SFRs) on local housing markets?

- 1. Prices, rents, home ownership
- 2. How do these impacts vary by
  - Industry development
  - Reallocation of existing stock
    - $\blacktriangleright$  owner ightarrow renter
    - $\blacktriangleright \text{ small} \rightarrow \text{professional landlord}$
    - between professional landlords

**Ex-ante:** while institutional ownership likely increases prices, unclear how it impacts rents and home ownership through which channels.

- 1. Construct panel of single-family portfolio holdings for each investor
- 2. Develop novel instrument for *Long Term Rental* (LTR) companies' entry into local housing markets
- 3. Estimate price/rent/ownership impact due to rise in LTRs

- 1. Construct panel of single-family portfolio holdings for each investor
- 2. Develop novel instrument for *Long Term Rental* (LTR) companies' entry into local housing markets
  - Cross-Sectional: Differential Market suitability for LTRs vs. Tradl. Landlords
  - Temporal: Development of decentralized management software
- 3. Estimate price/rent/ownership impact due to rise in LTRs

- 1. Construct panel of single-family portfolio holdings for each investor
- 2. Develop novel instrument for *Long Term Rental* (LTR) companies' entry into local housing markets
- 3. Estimate price/rent/ownership impact due to rise in LTRs
  - For the average Tract between 2010 & 2022, prices increase, rents don't change, and homeownership declines

- 1. Construct panel of single-family portfolio holdings for each investor
- 2. Develop novel instrument for *Long Term Rental* (LTR) companies' entry into local housing markets
- 3. Estimate price/rent/ownership impact due to rise in LTRs The average Tract with annual  $\uparrow$  in  $\Delta$ LTR share (0.02 p.p.)  $\implies$  0.24 p.p. house price increase, per year

- 1. Construct panel of single-family portfolio holdings for each investor
- 2. Develop novel instrument for *Long Term Rental* (LTR) companies' entry into local housing markets
- 3. Estimate price/rent/ownership impact due to rise in LTRs
  - ~Top 5% Tracts see an annual price increase of about 1.82 p.p., or an additional 40% relative to the average annual increase of 4.5 p.p.

- 1. Construct panel of single-family portfolio holdings for each investor
- 2. Develop novel instrument for *Long Term Rental* (LTR) companies' entry into local housing markets
- 3. Estimate price/rent/ownership impact due to rise in LTRs
  - ~Top 5% Tracts also see a decline in homeownership of about 0.6 p.p., triple the average annual decline.

- 1. Construct panel of single-family portfolio holdings for each investor
- 2. Develop novel instrument for *Long Term Rental* (LTR) companies' entry into local housing markets
- 3. Estimate price/rent/ownership impact due to rise in LTRs
  - Impacts vary by industry era
    - Prices and rents primarily rose with LTR market share during Covid-era

- 1. Construct panel of single-family portfolio holdings for each investor
- 2. Develop novel instrument for *Long Term Rental* (LTR) companies' entry into local housing markets
- 3. Estimate price/rent/ownership impact due to rise in LTRs
  - Impacts vary by source of reallocation of existing stock
    - Reallocations from owner-occupants & speculators to LTRs tend to lower prices: spillover from rising rental shares
    - Rents fell more where LTRs acquire the most from speculators & owner-occupants: consistent with supply expansion

### Data

- 1. Corelogic Deed Records and Tax Assessment: core dataset used to build portfolio holdings; SF+townhomes, '00-'22 Detail
- 2. FHFA Single-Family HPI: tract level, annual house price index, '00-'22
- 3. **CoreLogic MLS:** historical listing records for constructing repeat-listings *rent indices* for single-family homes; '00-'22; Zillow External Validation
- 4. **ACS/Census:** 1990 & 2010 to collect tract-level housing, socioeconomic, and demographic characteristics; 2009-2022 ACS 5-year estimates for *homeownership*
- 5. **Identifying investors:** SEC 10k filings, industry reports, OpenCorporates.com Detail

### **Building Portfolio Holdings**

Goal: We want to know which firms own what homes, when, and where.

- 1. Construct Ownership Panel Details
- 2. Potential Investor Set Details
  - ► 58 LTRs: Rent-to-Own (RtO) + Single Family Rental (SFR) + Private Equity Real Estate (PERE) firms, with mean holding period ≥ 3 yrs (Bayer et al. (2020); DeFusco, Nathanson & Zwick (2022)))
- 3. Name Harmonization Details

**This process yields:** an annual panel of investor *holdings* (units or value) For example, we know what AH4R owns by year & by census tract

### Overview of LTR Industry Growth

**Growth:** LTRs owned <u>70%</u> of holdings among top ~ 1,000 investors (Among All Homes) (State in 2022 **Concentration:** LTRs owned  $\geq$  9% of single-family homes in 99<sup>th</sup> percentile tracts (Over Time)

#### (a) National Investor Holding Share

(b) Local Single-Family Market Share

Notes: Panel (a): The national *investor* market share of firms identified as LTRs, Builders, and iBuyers, as measured by their portfolio holdings of single-family homes. Investors ranked by percentile in the distribution of average portfolio size (units). Panel (b): The distribution of *local* LTR market shares ( $ShareLTR_{it} = LTRunits_{it}/SFunits_{it}$ ) between 2010 and 2022, as measured by their portfolio holdings of single-family homes.

### How does LTR Market Presence Impact Local Markets?

Naive OLS:

$$\Delta Y_{it} = \alpha + \frac{\beta}{\Delta} \Delta LTRshare_{it} + \varepsilon_{it}$$

- $Y_{it}$  is prices  $(P_{it})$  or rents  $(R_{it})$
- ▶ *i* indicates Census Tracts
- t indicates year
- $\Delta LTRshare_{it}$ : change in share of single-family homes in tract i owned by any LTR at time t

#### Prior Literature Research Designs

How does LTR Market Presence Impact Local Markets?

Naive OLS:

 $\Delta Y_{it} = \alpha + \frac{\beta}{\Delta} \Delta LTRshare_{it} + \varepsilon_{it}$ 

Endogeneity concerns: LTRs select locations nonrandomly

- Reverse Causality: Locations with high returns attract LTRs
- Omitted Variable Bias/Simultaneity: Unobserved gentrification driving both price increases and attracting LTRs
- Measurement Error: We underestimate  $LTRshare_{it}$

Prior Literature Research Designs

### Towards an Instrument for Market Share

Goal: Build an instrument to exogenously vary LTR entry over time and space

#### Variation:

- Cross-Sectional: lagged characteristics of built environment and landlord preferences
- ► Temporal: Fall in property management costs

**Intuition:** LTRs only begin acting as single-family landlords once they can easily manage decentralized properties, and do so only in locations with sufficient single-family stock available

1. Identify housing characteristics favored by LTRs: LASSO selects subset of pairwise product characteristics useful in predicting  $\Delta M kt Share_i^{LTR}$  Details

- 1. Identify housing characteristics favored by LTRs: LASSO selects subset of pairwise product characteristics useful in predicting  $\Delta MktShare_i^{LTR}$  Details
- 2. Use selected pairwise characteristics to predict changes in market share for each landlord type  $l \in \{LTR, SLL\}$  Distribution of Portfolio Sizes

$$\Delta \mathsf{MktShare}_{i}^{l} = \sum_{j} \beta_{j} \mathsf{Prop}_{i}^{j} + \sum_{k} \gamma_{k} X_{i}^{k} + \delta_{c} + \varepsilon_{i}$$

tracts indexed by i, property characteristic by j, demographics+socioeconomics by k, county by c

- 1. Identify housing characteristics favored by LTRs: LASSO selects subset of pairwise product characteristics useful in predicting  $\Delta MktShare_i^{LTR}$  Details
- 2. Use selected pairwise characteristics to predict changes in market share for each landlord type  $l \in \{LTR, SLL\}$  Distribution of Portfolio Sizes

$$\Delta \mathsf{MktShare}_{i}^{l} = \sum_{j} \beta_{j} \mathsf{Prop}_{i}^{j} + \sum_{k} \gamma_{k} X_{i}^{k} + \delta_{c} + \varepsilon_{i}$$

- tracts indexed by i, property characteristic by j, demographics+socioeconomics by k, county by c
- 3. Apply delta method to identify *differential* product preferences

- 1. Identify housing characteristics favored by LTRs: LASSO selects subset of pairwise product characteristics useful in predicting  $\Delta MktShare_i^{LTR}$  Details
- 2. Use selected pairwise characteristics to predict changes in market share for each landlord type  $l \in \{LTR, SLL\}$  (Distribution of Portfolio Sizes)

$$\Delta \mathsf{MktShare}_{i}^{l} = \sum_{j} \beta_{j} \mathsf{Prop}_{i}^{j} + \sum_{k} \gamma_{k} X_{i}^{k} + \delta_{c} + \varepsilon_{i}$$

- tracts indexed by i, property characteristic by j, demographics+socioeconomics by k, county by c
- 3. Apply delta method to identify *differential* product preferences

 $\implies$  Yields list of product characteristics revealed preferred differently for LTRs vs. SLLs ( $\hat{\beta}_j$ )

1. So far: We know which characteristics different landlords prefer

- 1. So far: We know which characteristics different landlords prefer
- 2. **Next Step:** Construct "Suitability Index",  $S_i$ , which identifies locations more suitable for LTR entry relative to SLL

- 1. So far: We know which characteristics different landlords prefer
- 2. Next Step: Construct "Suitability Index",  $S_i$ , which identifies locations more suitable for LTR entry relative to SLL
- 3. **Concern:** Product characteristics (new supply) responds to landlord demand

- 1. So far: We know which characteristics different landlords prefer
- 2. Next Step: Construct "Suitability Index",  $S_i$ , which identifies locations more suitable for LTR entry relative to SLL
- 3. **Concern:** Product characteristics (new supply) responds to landlord demand
- 4. Solution: Utilize 1990 product characteristics

- 1. So far: We know which characteristics different landlords prefer
- 2. Next Step: Construct "Suitability Index",  $S_i$ , which identifies locations more suitable for LTR entry relative to SLL
- 3. **Concern:** Product characteristics (new supply) responds to landlord demand
- 4. Solution: Utilize 1990 product characteristics

$$S_i = \sum_j \hat{oldsymbol{eta}}_j imes \mathsf{Prop}_i^{1990,j}$$

- 1. So far: We know which characteristics different landlords prefer
- 2. Next Step: Construct "Suitability Index",  $S_i$ , which identifies locations more suitable for LTR entry relative to SLL
- 3. **Concern:** Product characteristics (new supply) responds to landlord demand
- 4. Solution: Utilize 1990 product characteristics

$$S_i = \sum_j \hat{oldsymbol{eta}}_j imes \mathsf{Prop}_i^{1990,j}$$

**Intuition:** LTRs only move into locations that have product characteristics compatible with their business model. **Partial 1st Stage** 

# Temporal: Improvements in Management Technology

- Historically, difficult to manage decentralized properties => 67% of rental units are in multifamily buildings (Census, 2022)
- Online Property Management (OPM) platforms enable management of decentralized properties without on-site superintendent or staff Concurrent Debt Offerings

### Research Design: OLS to IV

$$IV_{it} = \mathsf{Z}\operatorname{-}\mathsf{Score}\left(\frac{S_i \times \hat{F}_{\mathsf{funding}}(t) \times |PM|_{(-c)it}}{}\right)$$

$$\begin{array}{ll} \textit{First Stage}: & \Delta LTRshare_{it} = \alpha \Delta IV_{it} + \mathbf{X}'_{i}\mu + \delta_{ct} + \epsilon_{it}, \\ \textit{Second Stage}: & \Delta Y_{it} = \widetilde{\boldsymbol{\beta}} \Delta L \widehat{TRshare_{it}} + \mathbf{X}'_{i} \widetilde{\Gamma} + \delta_{ct} + \widetilde{\varepsilon}_{it}. \end{array}$$

- ► *i* indexes *tracts*, *t* indexes *years*
- $\blacktriangleright$   $Y_{it} \in P_{it}, R_{it}, Ownership_{it}$
- X<sub>i</sub>: baseline tract characteristics (supply elasticities, price changes during prior boom (2000-2006) and bust (2006-2010))
- ▶  $\delta_{ct}$ : county-by-year fixed effects

**Exclusion Restriction:**  $\mathbb{E}[IV_{it} \times \tilde{\varepsilon}_{it} | \mathbf{X}_i, \delta_{ct}] = 0$  (not testable)

### Placebo Test: Pre-Period Price Changes against Suitability Index We do not see any differential price changes in the period before LTRs or OPM for suitable vs. unsuitable locations.

Notes: This figure shows the binned scatterplot of total house price changes between 2000 and 2009 against our Suitability Index,  $S_i$ , controlling for county fixed effects, and local house price elasticities of supply. 14/21

### Identification Results

Second Stage : 
$$\Delta Y_{it} = \tilde{\boldsymbol{\beta}} \Delta L \widehat{TRshare}_{it} + \boldsymbol{X}'_i \tilde{\Gamma} + \delta_{ct} + \tilde{\varepsilon}_{it}$$
 (1<sup>st</sup> Stage)

	$\Delta {\sf HPI}_{\sf FHFA}$ (%)	$\Delta \text{Rent}_{\text{MLS}}$ (%)	$\Delta O$ wnership <sub>ACS</sub> (%)
Z-score $\Delta$ LTR Market Share (Unit)	1.575***	0.803	-0.526***
	(0.393)	(0.501)	(0.100)

Dep. Var Mean (%)	4.486	4.807	-0.182

1- $\sigma$  above the mean annual  $\Delta LTRshare$  (Top 5% Tracts)  $\implies$ 1.8 p.p.\*\*\*  $\uparrow \Delta Price$ , 1.0 p.p.  $\uparrow \Delta Rent$ , and 0.6 p.p.\*\*\*  $\downarrow \Delta Ownership$ 

### Heterogeneity by Period Industry's birth (2010-2014), Growth (2015-2019), COVID-19(2020-2022).

Price & rent increases driven by **COVID-19 era**; rents\* fell during **birth**, while prices\* fell during industry **growth**. Ownership

### Potential Mechanisms & Hypotheses

- 1. Professionalization:  $SLLs \rightarrow LTRs$ 
  - More aggressive rent-repricing (Calder-Wang and Kim, 2023) vs. lower marginal costs: ~ rents
  - ► Increases NOI  $\rightarrow \uparrow$  prices
- 2. Tenure Reallocation: owners  $\rightarrow$  renters
  - Rising investor share in single-family housing stock (Lambie-Hanson et al., 2022)
  - Expands local rental supply:  $\downarrow$  rents
- 3. **M & A:** LTRs  $\rightarrow$  LTRs
  - Increases market power → ↑ prices, ↑ rents (Austin, 2022; Billings and Soliman, 2023; Gurun et al., 2022)

### Define Reallocation Metrics at Tract Level

LTR's mainly buy from owner occupants (39%), each other (29%), speculators (23%), and other landlords (7%)

We measure how much LTRs buy on net from each investor type, g:

▶  $g \in \{$  Owner Occupants, Small Landlords, iBuyers, Speculators, Builders  $\}$ 

$$NetSales_g = (Transactions_{g \to LTR}) - (Transactions_{LTR \to g})$$

For homes traded *among* LTRs:

Count the number of LTRs active in a given tract in a year

### Mechanism Tests: Heterogeneity by Reallocation Metrics

- ▶ **Prices:** evidence that ↑ in renter share depresses prices
- **Rents:** strong support for *supply* channel

 Little evidence of impact due to concentration: counter to Austin (2022) & Gurun et al. (2022) likely due to studying *average* Tract instead of those swept up in mergers
# 2010-2022 $\downarrow$ in homeownership attributable to LTRs

Back-of-the-envelope LTR-induced change in homeownership of 0.43 p.p.

Assumptions:

- LTRs  $\rightarrow$  LTRs: no tenure change
- $\blacktriangleright$  Builders  $\rightarrow$  LTRs: adds directly to rental stock
- ▶ (iBuyers + owner-occupants)  $\rightarrow$  LTRs: owner-occupancy to rentals
- (Speculator + other small investors)  $\rightarrow$  LTRs: assume full vacancy to rentals Homeownership impact sum of changes in *tenure* as well as *vacancies*:
- Owner-occupants  $\rightarrow$  renters account for 0.32 p.p. (74%) decline
- ▶ Vacancies  $\rightarrow$  renters account for 0.11 p.p. (26%) decline

#### Conclusion

LTR companies fastest growing investor type  $\implies$  now own  $\sim$  415k SFR units

So far, declining rents are a bigger story than rising prices

- For the average Tract between 2010 & 2022, prices increase, rents don't change, and homeownership declines
- Large impact on prices & rents were limited to COVID-era
- Reallocations from owner-occupants & speculators to LTRs tend to lower prices
- Rents decrease in areas where LTRs acquire properties from speculators and owner-occupants, supporting their role in supply expansion
- Ongoing Research: Welfare trade-off between potential renters who benefit, and potential homebuyers who suffer

# CoreLogic Data Details

- >200 million detailed deed records from 1980s to 2022m10
- single-family houses and townhomes
- transaction dates, prices, addresses, buyer and seller information, etc.
- property characteristics from latest tax assessment
- only non-arms-length transactions
- ▶ Main sample: transactions between 2000 and 2022

#### External Validity of Estimated House Price Index

$$\log(P_{i,j,t}) = \sum_{\tau \in [1,N]} \beta_{i,\tau} \mathsf{X}_{i,t,\tau} + \alpha_{j,t} + \phi_m + \varepsilon_{i,t}, \tag{1}$$

where  $P_{i,j,t}$  is the price of unit *i*, in census tract *j*, in year *t*. X<sub>*i*,*t*, $\tau$ </sub> includes a suite of property characteristics including square footage, acreage, bedrooms, bathrooms, total rooms, and whether the unit has a garage or carport.  $\alpha_{j,t}$  is a census tract-by-year fixed effect, from which we construct our local HPI, and  $\phi_m$  is a month indicator to control for seasonality in housing market cycles.

#### How We Identify Investors Details

Starting from industry lists:

- ► SEC 10K Fillings: List of subsidiaries for publicly traded companies, such as REITs, single-family rental companies, or large asset managers in our data
- OpenCorporates: For the largest 10,000 investors we identify after name harmonization for which we cannot identify a parent, search OpenCorporates.com for parent company or shared addresses.

# Classifying Investor Types

Investor: a firm identified in our data as a non-owner-occupant.

- 1. Long Term Renter (LTR)
- 2. Builder
- 3. iBuyers
- 4. Small Landlords (SLL)
- 5. Other

# Classifying Investor Types

Investor: a firm identified in our data as a non-owner-occupant.

#### 1. Long Term Renter (LTR) : SFR+PERE+RTO, 43 firms

- Single Family Rental Company (SFR): a firm whose main activity renting out single-family homes, may be public corporation (Tricon Residential), public REIT (Invitation Homes), or private firm (FirstKey Homes, owned by Cerberus)
- Private Equity Real Estate (PERE): a firm broadly active in private equity market, that reports significant single-family real estate holdings, i.e. The Carlyle Group
- <u>Rent-to-Own</u> (RTO): a firm that buys a home on behalf of an occupant, and rents the home to the occupant with an option to buy. i.e. Home Partners of America (owned by Blackstone)
- Condition: everyone must hold units for at least 3 years on average. Matches speculator definition used in Bayer et al. (2020) and DeFusco, Nathanson, and Zwick (2022). Holding Period Dist
- Intuition: these real estate investors wish to accrue rental returns as well as (eventual) capital gains.

Investor: a firm identified in our data as a non-owner-occupant.

2. Builder: 232 firms

▶ a firm that builds homes (NVR, Pulte Homes, Lennar, etc.)

# Classifying Investor Types

Investor: a firm identified in our data as a non-owner-occupant.

- 3. iBuyers: 9 firms
  - firms that buy/sell homes through online platforms; provide liquidity to existing owners who wish to avoid lengthy sales process (Offerpad, Opendoor, RedfinNow, etc.)

Investor: a firm identified in our data as a non-owner-occupant.

- 4. Small Landlords (SLL):
  - Investors that fall outside the right tail of portfolio holdings:  $\leq$  150 units
  - Must hold units, on average, for  $\geq$  3 years (avoids speculators)
  - ▶ Three types: units  $\in [2, 5], [6, 25], [26, 150]$

Investor: a firm identified in our data as a non-owner-occupant.

5. Other: speculators (those with mean holding periods < 3 years long) and investors with 1 unit .

# Classifying Investor Types

Investor: a firm identified in our data as a non-owner-occupant.

- 1. Long Term Renter (LTR)
- 2. Builder
- 3. iBuyers
- 4. Small Landlords (SLL)
- 5. Other

Revealed preference analysis compares <u>LTR and SLL</u> as other investors do not supply rental housing as landlords. Back

#### How to Construct Ownership Panels

- 1. CoreLogic Deeds database
- 2. Impute the ownership and a fair market price (between transactions) for *every property*
- 3. 2000 and 2022 (or year built 2022)

# Filling in Missing Home Market Values

CoreLogic Deeds data only contains data on *transactions*, but we want an *annual* home value to later construct portfolio values for each investor.

- Impute market value by constructing tract-level HPIs fom CoreLogic data
- If census tract does not have enough transactions in a given year to construct a valid HPI, impute value for entire tract based off of FHFA's published HPI.

# Identifying Potential Set of Investors

- 1. Create a comprehensive list of non-individual entities identified by key ownership strings such as "LLC", "Corp", "Inc", "Capital", etc.
- 2. Supplemented with CoreLogic's proprietary corporate indicator
- 3. Manually remove government, public, and non-profit entities as well as individual and family trusts

# Name Harmonization & Disaggregating Common Names

- RapidFuzz Python package: Levenshtein string distance and fuzzily matches strings i.e. "Assoc." and "Association"
- Public Subsidiaries: collect a list of publicly traded firms from industry reports and scrape the SEC 10k filings for their lists of subsidiaries
- <u>Private Subsidiaries</u>: OpenCorporates, Florida Division of Corporations, and other online platforms for their subsidiaries. For example, "AMH4R Borrower YEAR-Q LLC." matched to "American Homes 4 Rent"
- <u>Common Individual Names</u>: Many units owned by same harmonized name "Rodriguez, Jose" which maps to thousands of different investors such as "Rodriguez Jose Trust" or "Rodriguez Jose LLC." For harmonized names identified as belonging to individuals, only allow portfolios up to county-level. Using Spacey Python package.

#### Why we do not aggregate based on shared mailing addresses: DEevidence

- We do not construct portfolios using mailing addresses due to the rise of institutions using professional registered agents, such as the Corporation Service Company.
- ▶ These agents handle all legal mailing and processing, and every LLC must list one.
- Professional registered agents may act on behalf of hundreds of clients; aggregating using a registered agent's address would potentially roll many portfolios into one firm.

### State of the Market in 2022

While LTR's hold a small share of total housing stock...

LTR ownership share among:	Median Across Tracts	Nationally
All Housing Units	0.24%	0.20%
Single Family & Townhome (SFTH) Units	0.37%	0.30%
Investor-Owned SFTH Units	3.28%	3.01%
(LTR+SLL)-Owned SFTH Units	4.26%	3.97%

... they own 1 of every 23 landlord-owned units in the median tract they've entered.

## Share of DE Mailing Addresses among non-DE Homes

Instead of tracking down a list of professional registered agent addresses, we leverage the fact that many of the largest firms (Corporation Services Company, Corporation Trust Company, etc.) have their registered agent offices in Delaware.

The share of DE mailing addresses for non-DE homes (2000q1=100) nearly quintupled around the time Invitation Homes launched the first ever public debt offering secured by single-family rental income.

#### Who are our Top SF Portfolios?

- ▶ 24 LTRs active in 2022 report holding  $\geq 466k$  units (missing 8 PERE)
- ▶ We identify 328,510 units held by these LTRs in 2022

Rank	Name	Category	First Active	Last Active	Avg. Holdings (units)
1	D.R. Horton	Builder	1978	2023	46422
2	Lennar	Builder	1954	2023	28932
3	Pulte Group	Builder	1950	2023	27869
4	Invitation Homes	SFR	2012	2023	25678
5	American Homes 4 Rent	SFR	2012	2023	24388
6	NVR	Builder	1980	2023	12477
7	Progress Residential	SFR	2012	2023	10100
8	FirstKey Homes	SFR	2015	2023	7638
9	KB Home	Builder	1957	2023	7559
10	U.S. Bank	Holding	1863	2023	6683

#### Investors' National Share of Single-Family Housing Stock No evidence of major national shift from owner-→renter-occupied stock.

Notes: These figures plot the national market share of properties owned by investors, rather than owner-occupants. Panel (A) shows the market share among all investors, while panel (B) shows the share among the largest investors, as measured by the average portfolio holding size in units

between 2010 and 2022.

#### **External Validity:** Calculated vs. Reported Holdings LTR Definition: Rent-to-Own (RtO) + Single Family Rental (SFR) + Private Equity Real Estate (PERE) firms, with mean holding period $\geq 3$ years

Notes: This figure plots our calculation of LTR's portfolio holdings as of 2022 in gray vs. reported holdings by said LTR's as of 2023. [Back]

#### **External Validity:** Calculated vs. Reported Holdings LTR Definition: Rent-to-Own (RtO) + Single Family Rental (SFR) + Private Equity Real Estate (PERE) firms, with mean holding period $\geq 3$ years

Notes: This figure plots our calculation of LTR's portfolio holdings as of 2022 in gray vs. reported holdings by said LTR's as of 2023. Back

#### **External Validity:** Calculated vs. Reported Holdings LTR Definition: Rent-to-Own (RtO) + Single Family Rental (SFR) + Private Equity Real Estate (PERE) firms, with mean holding period $\geq 3$ years

Notes: This figure plots our calculation of LTR's portfolio holdings as of 2022 in gray vs. reported holdings by said LTR's as of 2023. [Back]

# Distribution of Investors' Mean Holding Periods

**Notes:** This figure plots the distribution of the average holding period for all properties within a given investors' portfolio between 2010 and 2019. Following Bayer et al. (2020) and DeFusco et al. (2022), we limit the sample of properties to those purchased by 2019, which allows for at least three years of post-purchase data. We also exclude iBuyers since they, by definition, are not actively renting out properties.

# Market Share over Time

By 2022, LTRs owned 0.4% of all single-family & townhome units:

#### Concentration Over Time

Can calculate  $ShareLTR_{it} = LTRunits_{it}/SFunits_{it}$  for each tract, between 2010 and 2022:

#### State of the Market in 2022, Transactions

While LTR's turned over only 0.11% of the total housing stock in the median tract...

LTR transaction rate among:	Median Across Tracts	Nationally
All Housing Units	0.11%	0.03%
Single Family & Townhome (SFTH) Units	0.16%	0.04%
Investor-Owned SFTH Units	1.33%	0.43%
(SLL+LTR)-Owned SFTH Units	9.09%	10.27%

they traded about 10% of the landlord-owned stock.

**Note:** The median tract sees about 6% of the stock turnover in a given year; nationally 6.5% of homes turnover. Back

#### Prior Literature Research Designs

- 1. LTR Mergers: Gurun et al (2023), Austin (2023)
  - Mergers potentially selected to increase concentration in particular cities
  - Mergers limited to impact of concentration among LTRs; cannot address impact of expansion of LTRs through other channels
- 2. F&F First Look: Lambie-Hansen et al. (2022)
  - Only relevant to REO & foreclosure sales
  - These sales have declined since 2013

# Details on Identifying Favored Characteristics

- Least absolute shrinkage and selection operator (LASSO) following Derenoncourt (2022)
- LASSO selects pairwise product combinations useful for predicting changes in landlord market share 2010-2022
- Product Characteristics: the full set of variables yields 90 two-way product combinations with positive housing shares

**Benefit:** Reduces the potential number of pairwise characteristics predictive of changes in market share from 90 down to 42; removing extraneous characteristics from later estimation.

#### Distribution of Investor Size: Average Portfolio Holdings Most investors have small portfolios, but top 100 firms hold 3000+

**Notes:** This figure plots the distribution of average portfolio size, by percentile rank in the holding size distribution. We limit to the top 10% of investors by holding size for ease of inspection.

## Cross Sectional: Differential Revealed Preferences

LTRs differentially prefer mid-size, single-family homes, and dislike older homes *relative to* SLLs:

	(1)	(2)	(3)

# Cross Sectional: Examples of Differential Revealed Preferences

LTRs differentially prefer the following characteristics relative to SLLs:

- Single-family homes
  - **3-bed**: 1.090\*\*\*
  - $\circ~$  2-5 rooms:  $0.601^{**}$

LTRs differentially dislike the following characteristics *relative* to SLLs:

- Buildings with 2-4 units:  $-3.355^{**}$
- Older Homes
  - $\circ$  3 bed & 40+ years:  $-1.332^{***}$
  - $\circ$  4+ bed & 21-40 years:  $-1.136^{***}$
  - $\circ~$  2-5 rooms & 40+ years:  $-1.204^{***}$

Notes: Coefficient is the differential predicted market share in percentage points between LTRs and SLLs, induced by the tract's share of housing stocks having each two-way product characteristic. I.e. if a tract is 100% made of buildings with 2-4 units, this predicts an LTR market share 3.355 percentage points lower than the SLL market share. Table Back
### Cross Sectional: Partial 1st stage

Notes: This figure shows a binned scatterplot as well as a linear fit of  $\Delta LTRshare_i$  between 2010–2022 against the Z-score of the Suitability Index,  $S_i$ . We include county-level fixed effects to control for unobserved local heterogeneity, local house price elasticities of supply, and control for

house price dynamics over the boom and bust periods before 2010. Back

### Public Debt Offerings Over Time

Initial public offering of debt secured by rental income from single-family homes occurred in 2013q4. (Back)

Cumulative public issuance since 2013 of debt secured by portfolios of rented single-family homes has reached \$43 billion with debt outstanding of \$25 billion.

## Placebo Test: Pre-period Price Changes against Suitability Index We should not see any differential price changes in the period before LTRs or

OPM for suitable vs. unsuitable locations.

Notes: This figure shows the binned scatterplot of total house price changes between 2000 and 2009 against our Suitability Index,  $S_i$ , controlling for county fixed effects, and local house price elasticities of supply. 27

### HPI Sample: Impact of $\Delta IV$ on $\Delta LTR$

First Stage :  $\Delta LTRshare_{it} = \alpha IV_{it} + X'_{i}\mu + \delta_{ct} + \epsilon_{it}$  2<sup>nd</sup> Stage

	(1)	(2)	(3)	(4)
Dep. Var: Z-score $\Delta$ LTR	Full Sample	$\Delta \ LTR \ge 0\%$	$\Delta$ LTR $\geq$ 1% in 2022	$\Delta$ LTR in Top 10pct

	(0.002)	(0.002)	(0.003)	(0.004)
$\Delta$ FHFA HPI 06-10 (%)	-0.019*** (0.005)	-0.031*** (0.006)	-0.027*** (0.006)	-0.031*** (0.006)
Housing Supply Elasticity	-0.073	-0.006	0.048	0.094
	(0.074)	(0.107)	(0.182)	(0.157)
Observations	46,841	22,675	8,451	10,398
County $ imes$ Year FE	Y	Y	Y	Y
First Stage F Stat	31.49	46.10	18.99	29.11
$\Delta$ LTR Mean (%)	0.0480	0.101	0.235	0.202
$\Delta$ LTR S.D. (%)	0.218	0.300	0.443	0.410

**Interpretation:** 1- $\sigma \uparrow$  in  $\Delta IV \implies 0.199$ - $\sigma \uparrow \Delta LTRshare$ 

**Our Context:** With  $\sigma^{\Delta LTRshare} = 0.218$  in full sample,  $\implies$  43.0% (=  $0.218 \times 0.199/0.101$ )  $\uparrow \Delta LTRshare$  relative to the mean

## Heterogeneity by Period: Home Ownership

**Notes:** These figures show the differential impact of instrumented LTR market share on prices, rents, and homeownership by sample period. We divide the sample into three periods based on the industry's birth (2010-2014), its later growth(2015-2019), and the COVID-19 era characterized by large increases in the demand for residential space (2020-2022).

### Heterogeneity by Net Sale: Home Ownership

**Notes:** These figures show the differential impact of instrumented LTR market share on prices, rents, and homeownership by transition type. We divide the sample into three periods based on the industry's birth (2010-2014), its later growth(2015-2019), and the COVID-19 era characterized by large increases in the demand for residential space (2020-2022).

### Ownership Type Transition Matrix, Top 5% LTR Share Tracts LTRs bought nearly 5% of all homes transacted, and sold less than 2%.

		Seller Type				
		Other Investor	LTR	Builder	<b>Owner Occupants</b>	Total
be	Other Investor	4.84	0.15	0.05	12.51	17.56
Ļ	LTR	1.56	1.40	0.05	1.82	4.83
er	Builder	0.05	0.01	0.02	0.09	0.17
Buy	Owner Occupants	13.08	0.15	0.30	63.91	77.44
-						
	Total	19.53	1.71	0.42	78.34	100.00

Back

#### Sanity checks

Builders sell 2.5x more than they buy (limited to tear-downs, no data on vacant land sales)

iBuyers (not shown) sold 80% of their purchases by 2022  $\rightarrow$  consistent with business model of intermediation rather than renting

# Correlation between $Top_g$ Flags, *Prices*

	SLL	Spec.	00	iBuyer	Builder
SLL	1				
Spec.	0.47	1			
00	0.46	0.56	1		
iBuyer	0.23	0.30	0.28	1	
Builder	0.21	0.24	0.19	0.18	1

# Correlation between $Top_g$ Flags, *Rents*

	SLL	Spec.	00	iBuyer	Builder
SLL	1				
Spec.	0.43	1			
00	0.36	0.57	1		
iBuyer	0.13	0.19	0.25	1	
Builder	0.08	0.13	0.13	0.03	1

### Reallocation Results - By Subsample, Rents

#### For the renter market:

Whenever there is a significant reallocation from owners to renters  $\implies \downarrow \Delta ZORI$ More local competition  $\implies \downarrow \Delta ZORI$  (Horse Race, Rent)
